

# NewsWay **imaging Server**

ProImage NewsWay Module

**Drives a large number of different output devices**

**Fully automated output management**

**Provides for easy migration between output technologies**

**NewsWay imaging Server – manages your resources efficiently**

NewsWay imaging Server along with NewsWay load Balancing, is a complete output management system that will maximize productivity and generate savings on capital investment -as well as time.

**We make  
complex  
publishing  
simple.**

Managing expensive resources efficiently is the key to lower capital costs and to higher efficiency. In today's highly competitive world this can mean additional profit margin, or a lower price to win that valuable contract.

NewsWay imaging Server is a NewsWay system module that may be seamlessly used either as the output module for a number of individual ProImage solutions, or as the

output module for a larger integrated NewsWay system.

NewsWay imaging Server will drive the most popular film and platesetters (of which a current detailed list is separately available from ProImage). NewsWay imaging Server incorporates many of the popular features of NewsWay such as total visibility across the enterprise, simple drag-and-drop operation and fast, robust performance.

We make complex publishing simple.

One of the many unique features of the NewsWay imaging Server is the standard PCI interface card that it uses. Known as the NFB (NewsWay FlexiBoard), it is possible to change the imagesetter being driven without changing this card in the computer hardware. The physical connections of the NFB are altered by firmware automatically downloaded to the board once the output device is selected. This feature allows users to change generations of image and platesetting equipment without having to make any hardware alterations in their workflow systems.

*It is easy to configure output devices through set-up screens*

Driven by the NewsWay load Balancing feature NewsWay imaging Server can, by queuing jobs to available resources, manage multiple imagesetters in the most efficient way without manual intervention.

NewsWay imaging Server will take into account color separation locking globally or by section. It is possible to enable or disable locking features, for instance in environments where imagesetter accuracy is within tolerances to not need locking. NewsWay imaging Server will also drive mixed imagesetter environments. For example, to 3 film setters and 2 CTP devices with the system automatically assigning jobs to the appropriate device.
