ProImage proof Server – proofs across the enterprise

ProImage's proof Server is a versatile soft proofing solution for publishers.

Running on the NewsWay platform, the ProImage proof Server will provide users with instant soft proofs and edition tracking capabilities, saving time. And because NewsWay is Web-based, soft proofs are available throughout a local or wide area network, or even the Internet – all without having to install special workstations. The capability to publish proofs to authorized users over the Internet enables publishers to instantaneously share proofs with customers and printers.

ProImage proof Server provides color balanced screen proofs, even emulating the color of the stock on which the job is to be printed, and can be installed to run in parallel with existing production systems.

Proofs are automatically generated for each individual separation as it becomes available in the production stream, even before being output through an imagesetting device. Once all separations become available, a 4-color composite proof will be generated

automatically. Available are all individual proofs of single colors as well as the combined 4-color proof. Users may also zoom-in to a specific area to see the dot structure or the rosettes that form the page.

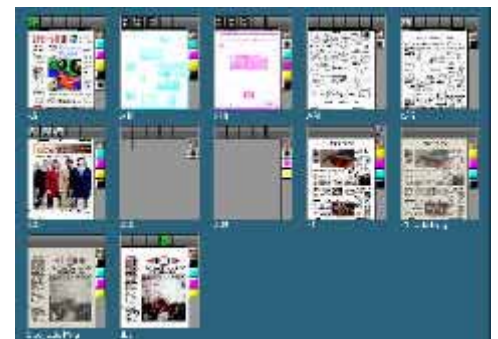

ProImage proof Server has proven its cost-effective use in editorial, pre-press and press environments where checking pages for placement (post-RIP) and content, as well as color matching, has reduced error, saved valuable time - and money.
